Listing of Communities

Communities, by State, with natural fluoride concentrations of 0.7 ppm or more in community water supplies, showing population served and fluoride concentrations.	17
--	----

INTRODUCTION

A survey to determine the number and location of community water supplies containing dentally significant concentrations of naturally occurring fluorides was made in early 1969 by the State Dental Directors at the request of the U.S. Public Health Service. This publication presents the results of this survey and serves to update a similar document published in 1959.¹ The 1959 publication included all communities reporting at least one water source with a natural fluoride concentration of 0.7 parts per million (ppm)² or higher. This publication differs in that it lists all communities whose water supplies were reported to have a natural fluoride concentration of 0.7 ppm or more regardless of the concentration of the various sources of water. This survey attempted to identify public water systems in the United States which naturally contain the minimum fluoride concentration recommended by the Public Health Service as optimal for protection against dental caries.

The optimum concentration of fluorides in community water supplies depends upon the annual average of maximum daily air temperatures in the individual community. According to Public Health Service Drinking Water Standards, 1962, the recommended concentrations are shown in Table 1.

The following table shows that the optimal fluoride concentration is not the same for every community, although 1.0 part per million is optimal for most communities in the United States. In this publication, water supplies with less than 0.7 ppm are not listed

TABLE 1.

Annual average of maximum daily air temperatures *	Recommended control limits— Fluoride concentrations in mg/l		
	Lower	Optimum	Upper
50.0-53.7	0.9	1.2	1.7
53.8-58.3	0.8	1.1	1.5
58.4-63.8	0.8	1.0	1.3
63.9-70.6	0.7	0.9	1.2
70.7-79.2	0.7	0.8	1.0
79.3-90.5	0.6	0.7	0.8

* Based on temperature data obtained for a minimum of five years.

1 Natural Fluoride Content of Communal Water Supplies in the United States, U.S. Department of Health, Education, and Welfare, Public Health Service, Publication No. 655, 1959.

2 Parts of fluoride per million parts of water, by weight.

because such supplies have less than the lowest concentration recommended as optimum by the Public Health Service for the warmest climate. As can be seen in Table 1, 0.7 ppm of fluoride is recommended for optimal protection against caries in only the warmest climates in the country. Figure 1 shows how the protection against caries varies relative to the optimal concentration of the fluoride ion in the water supply. The data used in this Figure were calculated using 1.0 part per million fluoride as the optimal concentration. It demonstrates the degree of protection that sub-optimal concentrations of fluoride can provide.

Figure 1.—ANTI-CARIES VALUE OF SUBOPTIMAL CONCENTRATIONS OF FLUORIDE ION

Based on Dean, Arnold, and Elvove: Domestic Water and Dental Caries, V. Additional Studies of the Relation of Fluoride Domestic Waters to Dental Caries Experience in 4,425 White Children Aged 12 to 14 Years, of 13 Cities in four States.

The listing beginning on page 17 shows the population and fluoride concentration for each community, by State, with 0.7 ppm or more natural fluoride in the community water supply. The States were asked to report the most recent population of communities. In most cases, the population statistics from the 1960 Census was the latest available, and for this reason the total number of people consuming natural fluoride-bearing water at present is under-estimated.

The fluoride concentrations appear in the listing as single numbers, multiple numbers and in some cases no numbers. Where a single concentration is listed, the actual fluoride concentration of the water within the distribution system, or a reasonable estimate of the concentration, was reported. This applies whether the water supplied to the distribution system comes from one or several sources. Summary data on communities which have a single number in the listing is given in Table 2, under the column heading "Single Concentration Reported."

The listing of two or more fluoride concentrations resulted from two different kinds of reporting. In one instance, the States of Florida, California, and New York reported maximum and minimum concentrations of multiple chemical analyses of a single source or the maximum and minimum concentrations of most sources which supply the water distribution system. New York reported not only maximum and minimum concentrations, but also supplied an average which is given in the listing. Summary data for these communities are given in Table 2 under the column heading "Communities with Maximum and Minimum Concentrations Reported."

On the other hand, most communities in States other than California, Florida, and New York for which two or more concentrations are listed do not have a uniform fluoride ion distribution within the water system. Thus, the fluoride concentration of each water source is given. Summary data for these communities are given under the column heading "Multiple Concentrations Reported."

In a few instances in the listing, no fluoride concentration is given. In these cases, it was reported that the natural fluoride content within the water distribution system was 0.7 ppm or more, but the exact concentration was not given.

Following the names of some communities in the listing, the words "Blending," "Main Opt" (Maintains the optimal fluoride concentration), and "Defluoridating" appear. Communities which carry such notations purposefully maintain the fluoride level of their natural fluoride-bearing water at the optimal concentration.

From this study, it is estimated that there are now 8,106,435 people in 2,630 communities in forty-four States consuming water with at least 0.7 ppm naturally occurring fluorides (Table 2). This represents an increase of 1,154,033 people and 727 communities reported to be using water supplies with natural fluoride since the last survey was reported in 1959. In other words, there are 17 percent

more people and 38 percent more communities using water supplies with at least 0.7 ppm naturally occurring fluoride than in 1959. A comparison of the 1959 and 1969 maps (Figures 2 & 3) graphically illustrates this change. This change suggests a significant increase. However, part of this increase may be attributed to population growth and the remainder is probably largely the result of more accurate and complete information supplied by the States rather than a trend towards increased use of natural sources for fluoridation. In fact, the trend appears to be away from natural sources and towards controlled fluoridation. For instance, two large cities in Texas—Dallas and Fort Worth—with almost a million and a half people, changed from natural sources of fluoride-bearing water to controlled fluoridation.

During this survey it was learned that in Houston, Texas, only 290,000 people were consuming water with 0.7 ppm or more fluoride ion instead of 900,000 as had been previously reported.

Because of the criteria used in this survey, the switch by some communities from natural sources to controlled fluoridation and the discovery that in some cases the fluoride ion was not as widely distributed as had been previously indicated, the reported increase in the number of people consuming dentally significant concentrations of fluorides was not as great as anticipated.³

Most of the communities reported to be using natural fluoride-bearing water—62 percent—are located in the following States: Arizona, Colorado, Illinois, Iowa, New Mexico, Ohio, Oklahoma, South Dakota and Texas. There were no communities with at least 0.7 ppm naturally occurring fluoride reported for Delaware, Hawaii, Massachusetts, Pennsylvania, Tennessee, and Vermont (Table 2 and Figure 3).

The survey data indicate that 1,517 communities with 5,782,628 people (71 percent of the total) drink water that has an average natural fluoride content within the range 0.7 to 1.2 ppm—the range recommended by the Public Health Service (Table 3, Figures 4 & 6). It was reported that there are now 1,366,533 people (17 percent of the total) in 589 communities drinking water with an average

³ Projections based upon previous surveys estimated that 10 million people are now consuming water with a naturally occurring fluoride concentration of 0.7 ppm or higher.

natural fluoride content between 1.3 and 2.0 ppm, 712,253 people (nine percent of the total) in 386 communities using water with 2.1 to 3.9 ppm fluoride, and 245,021 people (three percent of the total) in 138 communities drinking water which has more than 4.0 parts per million fluoride. While the people consuming water with more than the optimal concentration of fluoride from birth may have fewer cavities, they stand the risk of developing mottled teeth. Those people who consume the optimal concentration of fluorides from birth will receive the maximum protection against caries and will be free from unesthetic mottling.

As may be seen from Table 5 and Figures 7 and 8, most of the communities with natural fluoride sources have small populations. Thirty-two percent of these communities have between 100 and 499 people. Only eight communities, or 0.31 percent of the communities listed herein, have over 100,000 people (Table 5 and Figures 7 and 8). However, these eight communities contain 1,320,104 people, or 16 percent of the total number of people reported to be drinking water with a natural fluoride content of 0.7 ppm or greater.

This compilation of the latest available information on the use of natural fluoride bearing waters is intended to assist those interested in keeping abreast of the availability of fluoride, regardless of its source, for safe and effective prevention of tooth decay.

Listing of Communities

KEY TO LISTING

SD	Sanitary District
WD	Water District
PART	Part of a community has water with at least 0.7 ppm natural fluoride
BLENDING	Blends sources to the optimal concentration
DEFLUORIDATING	Removes fluorides to the optimal concentration
SUB	Subdivision
WC	Water Company
MAIN OPT	Maintains the optimal fluoride concentration in the water supply system

COMMUNITIES, BY STATE, HAVING NATURAL FLUORIDE CONTENT
OF .7 PPM OR GREATER IN COMMUNITY WATER SUPPLY
